

Sales Analysis with Power BI

- Hishaam J

Objective:

To prepare, clean, transform, and model E-commerce sales data using Power BI and Power Query to create an accurate and business-ready data model for analysis and reporting.

Formulas Used:

1. Location = 'List of Orders'[City]&" "&'List of Orders'[State]
2. Profit Margin = 'Order Details'[Profit]/'Order Details'[Amount]
3. Profit Status = IF('Order Details'[Profit]<0,"Loss", IF('Order Details'[Profit]=0,"Break Even","Profit"))

Key Activities:

- Imported List of Orders, Order Details, and Sales Target datasets into Power BI.
- Performed data cleaning and transformation by setting appropriate data types, formatting text, and creating calculated columns.
- Created a Location column by merging City and State fields.
- Calculated Profit Margin and categorized orders as Profit, Loss, or Break-Even using conditional logic.

- Handled missing values and duplicate records based on business requirements.
- Merged datasets using Order ID to create a unified Orders Data table.
- Applied sorting, filtering, grouping, and aggregation techniques to analyze sales and profit performance.
- Established relationships between tables to build an efficient data model for reporting and analysis.

Tools Used:

Power BI, Power Query Editor

Skills Demonstrated:

Data Transformation, Data Cleaning, Data Integration, Data Modeling, Data Aggregation, Business Logic Implementation, and Data Quality Management.

Outcome:

Developed a structured and reliable data model that supports business analysis, performance tracking, and data-driven decision-making through accurate and well-organized datasets.
